## 2 Ordered sets

When the partial (total) order is understood, we will usually write E instead of  $(E, \leq)$ . Henceforward we consider the sets  $\mathbb{R}$  and  $\overline{\mathbb{R}}$  with the total order relations defined in the examples above. A subset A of a partially (totally) ordered set E is a partially (totally) ordered set with the partial (total) order inherited from E.

**Example 2.1.** N is a totally ordered sets with the relation inherited from  $\mathbb{R}$ .

**Example 2.2.** The total order of  $\mathbb{R}$  coincides with the one inherited from  $\overline{\mathbb{R}}$ .

**Definition 2.3.** Let  $(E, \leq)$  be a partially ordered set. Let A be subset of E. An element c of A is called the **least element** (**greatest element**) of A if  $c \leq x$  ( $c \geq x$ ) for every x in E.

When a least or greatest element of a subset A of E exist it is unique.

**Definition 2.4.** Let  $(E, \leq)$  be a partially ordered set. Let A be subset of E. An element c of E is called a **lower bound** (an **upper bound**) of A if  $c \leq x$  ( $c \geq x$ ) for every x in E. We say that A is **bounded bellow** (**bounded above**) if it has a lower bound (an upper bound).

**Definition 2.5.** Let E be a partially ordered set. Let A be subset of E. A lower bound (an upper bound) c of E is called the **infimum** (**supremum**) of A, and we denote it as inf A (sup A), if c is the greatest (least) element of the set of all lower (upper) bounds of A.

When a infimum or supremum of a subset A of E exist it is unique.

**Property 2.6.** Let  $(E, \leq)$  be a totally ordered set. Let A be a subset of E. An element c of E is the infimum (supremum) of A if and only if for every x in E:

 $c < x(x < c) \implies x$  is not a lower bound (an upper bound).

For every bounded below (above) subset A of  $\mathbb{R}$  the infimum (supremum) of A exits.

**Property 2.7.** For every subset A of  $\overline{\mathbb{R}}$  the infimum and supremum of A exit.

Let x and y be two elements of a totally ordered set  $(E, \leq)$ . We say that an element z of E is **beteween** x and y if  $x \leq z \leq y$  or  $x \geq z \geq y$ .

**Definition 2.8.** Let E be a totally ordered set. We say that a subset I of E is an **interval** if it contains every element between two elements of it.

**Property 2.9.** Intervals in  $\mathbb{R}$  could be characterized as one of the following sets:

$$\begin{split} ]-\infty,\infty[ &:= \mathbb{R}, \\ ]-\infty,b] := \{x \in \mathbb{R} \; ; \; x \leq b\}, \\ ]-\infty,b[ &:= \{x \in \mathbb{R} \; ; \; x < b\}, \\ [a,\infty[ &:= \{x \in \mathbb{R} \; ; \; x \geq a\}, \\ ]a,\infty[ &:= \{x \in \mathbb{R} \; ; \; x \geq a\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a \leq x \leq b\}, \\ [a,b[ &:= \{x \in \mathbb{R} \; ; \; a \leq x \leq b\}, \\ ]a,b] &:= \{x \in \mathbb{R} \; ; \; a < x \leq b\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a < x \leq b\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a < x \leq b\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a < x \leq b\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a < x \leq b\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a < x \leq b\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a < x \leq b\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a < x \leq b\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a < x \leq b\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a < x \leq b\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a < x \leq b\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a < x \leq b\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a < x \leq b\}, \\ [a,b] &:= \{x \in \mathbb{R} \; ; \; a \leq x \leq b\},$$

with a and b in  $\mathbb{R}$ .

**Property 2.10.** Intervals in  $\overline{\mathbb{R}}$  could be characterized as one of the following sets:

$$[-\infty, \infty] := \overline{\mathbb{R}},$$

$$[-\infty, \infty[ := \{x \in \overline{\mathbb{R}} : x < \infty\},$$

$$] - \infty, \infty] := \{x \in \overline{\mathbb{R}} : x > -\infty\},$$

$$] - \infty, \infty[ := \{x \in \overline{\mathbb{R}} : x < b\},$$

$$[-\infty, b] := \{x \in \overline{\mathbb{R}} : x < b\},$$

$$[-\infty, b] := \{x \in \overline{\mathbb{R}} : x \leq b\},$$

$$] - \infty, b[ := \{x \in \overline{\mathbb{R}} : x \leq b\},$$

$$] - \infty, b[ := \{x \in \overline{\mathbb{R}} : -\infty < x < b\},$$

$$[a, \infty] := \{x \in \overline{\mathbb{R}} : x \geq a\},$$

$$[a, \infty] := \{x \in \overline{\mathbb{R}} : x \geq a\},$$

$$[a, \infty] := \{x \in \overline{\mathbb{R}} : x \geq a\},$$

$$[a, \infty] := \{x \in \overline{\mathbb{R}} : x \leq a\},$$

$$[a, \infty] := \{x \in \overline{\mathbb{R}} : a \leq x < \infty\},$$

$$[a, 0] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

$$[a, b] := \{x \in \overline{\mathbb{R}} : a \leq x \leq b\},$$

with a and b in  $\mathbb{R}$ .

For every a and r in  $\mathbb{R}$  with r > 0 we called the set  $]a - r, a + r[\subset \overline{\mathbb{R}}]$  as the open interval centered at a with radius r.
